INTRODUCTION

In an effort to further our understanding of the physical and biological environment in which the North Pacific high seas driftnet fisheries operate, a collaborative multinational research cruise was conducted within waters of the North Pacific subarctic frontal zone. During 11 October-5 November 1989, personnel from the Honolulu Laboratory of the Southwest Fisheries Science Center, Auke Bay Laboratory of the Alaska Fisheries Science Center, National Marine Mammal Laboratory, Taiwan Fisheries Research Institute, and the Korea Ocean Research and Development Institute participated in the NOAA ship *Townsend Cromwell* cruise 89-09 conducting operations to observe and quantify the distribution and abundance of pelagic fish, cephalopod, and marine mammal species of the central North Pacific in relation to the ocean temperature and salinity structure near the subarctic boundary. This report presents the hydrographic observations made with expendable bathythermograph (XBT) and conductivity-temperature-depth (CTD) casts during the course of the cruise. We emphasize that the intent of this compilation is not to analyze the thermohaline structure of the subarctic frontal zone but rather to simply present the oceanographic observations in a summarized form for the information of interested parties.

The cruise track, schematically represented in Figure 1, originated in Juneau, Alaska (departing 11 October 1989), and concluded in Honolulu, Hawaii (arriving 5 November 1989). While in transit to and from the sampling transect, XBT casts were made every 6 hours. Within the study area, CTD and XBT casts were planned at stations 15 nmi apart along the 155°W and 165°W meridians between latitudes 38°N and 46°N. At selected sites, biological sampling accompanied the environmental observations. Unfortunately, due to adverse weather and sea conditions, many of the operations scheduled on the original station plan were altered or abandoned (see TC 89-09 Final Cruise Instructions and Narrative Cruise Report). The operations and relative positions of the completed sampling stations are presented in Figure 2. Nearly all of the environmental stations along the 155°W meridional transect were completed and enabled compilation of south to north vertical profiles (averaged in 5 m bins) of temperature, salinity, and density (sigma-t) distribution (Fig. 3).

A total of 43 CTD casts, primarily at 15 nmi intervals along the meridional transects, were made with a SeaBird model SBE 9/11 CTD system configuration. The casts were initially conducted to a depth of 1,000 m; however, on the seventeenth cast the conducting cable on the hydrographic midwinch of the vessel was damaged at the 960 m mark. Subsequent casts were conducted only to a depth of 900 m.

Downcast CTD data were averaged in 5 m bins to create the tabular summaries in this report and in 2 m bins for the graphic temperature-salinity profiles. Each tabular summary includes the water properties: pressure (decibars), temperature ($^{\circ}\text{C}$), salinity (ppt), density (σ_t), and sound velocity (m/s). For pressures between 100 and 250 dbars, corresponding water properties are presented for only each 10 dbar change, and for pressures greater than 250 dbars, observations are listed for each 50 dbar change. The data from cast no. 38 (Stn. 111) conducted at $43^{\circ}00.2'\text{N}$ $165^{\circ}00.0'\text{W}$ was lost on a defective data storage disk and thus is not presented among the tables and plots.

During the cruise, 101 XBT casts were made through the Shipboard Environmental (Data) Acquisition System (SEAS) III. The unedited temperature profiles and whole degree isotherms as determined through the SEAS III software for 99 of the casts are presented; two casts (no. 48 and 77) were deemed unusable.

Figure 2.--Sampling stations on Townsend Cromwell cruise 89-09, October 11 to November 5, 1989.

Figure 3.--South-north vertical sections of water properties at 155°W in the central North Pacific: (A) temperature (°C), (B) salinity (ppt), (C) density (sigma-t).
